

GREENLAND

Free VST2 / VST3 polyphonic synthesizer plugin for Windows by **OVM PLUGIN**

A / OSCILLATORS

Two oscillators, each equipped with different modulators, as well as a shared section offering further options, and a sub-oscillator.

B / FILTERS

A choice of seven filters (LP / HP / BP) with a dedicated envelope, as well as tracking and velocity.

C / LFOs - EG

Three LFOs with key options (the third can be delayed), as well as a Shape envelope with presets.

C / AMPLITUDE

Amplitude envelope with glide and velocity options. The Mono/Poly options are located at the top of the synthesiser.

D / RANDOMISER

Create random presets with a single click. You can include different parts of the synthesiser in the process by selecting them one by one.

E / SEQUENCER

A 16-step sequencer offering a wide range of options and randomisation functions. It allows you to generate random scale patterns and harmonise each scale mode (major or minor). Each step can slide the pitch to the next step. The sequencer also allows you to modulate four targets.

F / CHORDER - ARPEGGIATOR

A four-part chord can be configured to be played with a single finger, with a choice of the number of voices and all inversions. The chord can be harmonised to fit each degree of a major or minor scale.

The chord generator can be used with the arpeggiator. The arpeggiator can be used without the chord generator, but the two cannot be used simultaneously with the sequencer.

G / EFFECTS

Five standard effects with full controls, plus a three-band equaliser.
